

## FileCoin X Moralis Hackathon Project Overview

Da Socia is the project I undertook during the hackathon, this is a social media app functioning on the blockchain(Polygon testnet) where people can post whatever they want uncensored and can monetize their posts either selling them as NFTs, getting tips and charging their posts.

The app guarantees true ownership as each post can be minted as an NFT to the owner. The idea for the project came from observing that there are few apps that afford ownership of content, ability to monetize content and being censorship free.

In addition to working with polygon, I also used Moralis and the Filecoin functionality it comes with. I can say it was a good experience.

### Use Cases

The app can be used for multiple things and use cases but the main use cases for the app are the following;

- For content creators to freely create content they want and being able to monetize it by selling the post NFT or getting tips from followers.
- For individuals that want to mint their special posts as NFTs and due to the immutable nature of the blockchain and IPFS, these post NFTs can essentially be held forever.

### Team

I am Ajuzie sinachi from Nigeria presently a CS undergrad, I'm a solidity and backend developer who is passionate about blockchain and wants to build on it.

The project was built by me from the ground up from the smart contracts to the scripts and frontend. I faced a lot of difficulty when building out the frontend as I am not a frontend person but I made sure to put in my best.
